

Visualizing Multilevel Models

Andy Grogan-Kaylor

16 Mar 2023 17:00:50

Introduction

An evolving set of notes on visualizing results from multilevel models.

When this document is presented in *slide show format*, some slides may be long, and you may need to *scroll down* to see the full slide. In slide show format use the left and right arrow keys to navigate through the slides. **b** will make the text bigger. **s** will make the text smaller.

The examples below use the `simulated_multilevel_data.dta` file from *Multilevel Thinking*. Here is a direct link to download the data.

Organizing Questions

Try to think about some of the advantages and disadvantages of different approaches to visualizing multilevel models. In multilevel models, we don't want to just *control for* variation, but to start to *explore* the variation. Put concretely:

- Some approaches use *dots*. Some approaches use *lines*. Some approaches use *dots and lines*.
- Some approaches use the *raw unadjusted* data. Other approaches use *adjusted or model predicted* data.
- Some approaches attempt to show the *Level 2 specific regression lines*; some approaches only show an *average regression line*.
- What approaches might work well with *large numbers* of Level 2 units? What approaches might work well with *smaller numbers* of Level 2 units?

What approach(es) do you prefer?

Setup

I am not terrifically fond of Stata's default `s2color` graph scheme. Therefore I make use of the `michigan` graph scheme available at: <https://agrogan1.github.io/Stata/michigan-graph-scheme/>

```
. set scheme michigan
```

Stata's `s1color` scheme would also be an option as would be Asjad Naqvi's incredible `schemepack`: <https://github.com/asjadnaqvi/stata-schemepack>

Get Data

```
. use "https://github.com/agrogan1/multilevel-thinking/raw/main/simulate-and-analyze-multi  
> level-data/simulated_multilevel_data.dta", clear
```

Scatterplots (twoway scatter y x)

```
. twoway scatter outcome warmth  
  
. graph export myscatter.png, width(1500) replace  
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/myscatter.png saved as PNG  
format
```

Figure 1: Scatterplot

Simple Linear Fit (twoway lfit y x)

```
. twoway lfit outcome warmth  
  
. graph export mylinear.png, width(1500) replace  
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/mylinear.png saved as PNG  
format
```

Linear Fit With Confidence Interval (twoway lfitci y x)

```
. twoway lfitci outcome warmth  
  
. graph export mylfitci.png, width(1500) replace  
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/mylfitci.png saved as PNG  
format
```

Combine Scatterplot and Linear Fit (twoway (scatter y x) (lfit y x))

```
. twoway (scatter outcome warmth) (lfit outcome warmth)  
  
. graph export myscatterlinear.png, width(1500) replace  
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/myscatterlinear.png saved  
as PNG format
```

Figure 2: Linear Fit

Figure 3: Linear Fit With Confidence Interval

Figure 4: Scatterplot and Linear Fit

Spaghetti Plots (`spagplot y x, id(group)`)

```
. spagplot outcome warmth, id(country)

. graph export myspaghetti.png, width(1500) replace
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/myspaghetti.png saved as
  PNG format
```

Small Multiples (`twoway y x, by(group)`)

Small Multiples, showing a separate graph for each group in the data, are an increasingly popular data visualization technique. Below, I build a small multiples graph using the `by` option in Stata.

I use the `aspect` option to adjust the *aspect ratio* of the graph for better visual presentation. I also use the `mcolor(%30)` option to create some transparency in the dots of the scatterplot, which helps the presentation of these small multiples. The `mcolor(%30)` option could be useful in the other graphs in this tutorial as well.

```
. twoway (scatter outcome warmth, mcolor(%30)) (lfit outcome warmth), by(country) aspect(1
> )

. graph export mysmallmultiples.png, width(1500) replace
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/mysmallmultiples.png saved
  as PNG format
```

Taking A Random Sample

At times, we may have *too many* Level 2 units to effectively display them on a *spaghetti plot*, or using *small multiples*. If this is the case, we may need to *randomly sample* Level 2 units. This can be difficult to accomplish as our standard `sample` command operates on each row, or on Level 1 units.

We can accomplish random sampling at Level 2, with a little bit of code.

```
. set seed 3846 // random seed for reproducibility
```

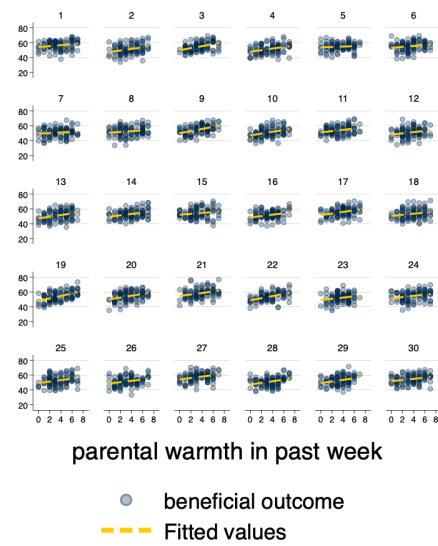

Figure 5: Spaghetti Plot

Graphs by country id

Figure 6: Small Multiples

```

. gen randomid = runiform() // generate a random id variable

. * by country (i.e. by Level 2 unit) replace the randomid
. * with the first randomid for that country (Level 2 unit)
. * so that every person in that country has the same random id

. bysort country: replace randomid = randomid[1]
(2,970 real changes made)

. summarize randomid // descriptive statistics for random id

```

Variable	Obs	Mean	Std. dev.	Min	Max
randomid	3,000	.6174022	.2374704	.0733026	.9657055

```

. twoway (scatter outcome warmth, mcolor(%30)) /// scatterplot
> (lfit outcome warmth) /// linear fit
> if randomid < .5, /// only use a subset of randomid's
> by(country) aspect(1) // by country

. graph export mysmallmultiples2.png, width(1500) replace
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/mysmallmultiples2.png
saved as PNG format

```

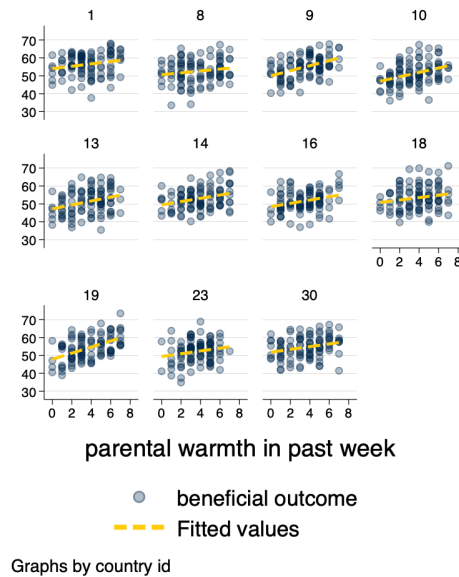

Figure 7: Small Multiples With A Random Sample Of Countries

Multivariate (Predicted) Relationships

A sometimes unacknowledged point is that graphs—unless we take steps to correct this—reflect *unadjusted*, or *bivariate* associations. We may sometimes wish to develop a graphs that reflect the *adjusted* or *predicted* estimates from our models.

In multilevel models, *prediction* is a complex question. The procedures below outline graphs that incorporate predictions using the variables, but do not include predictions that incorporate the random effects. (This will be added!)

Using Predicted Values (predict)

Estimate The Model

```
. mixed outcome warmth physical_punishment i.group || country: // estimate MLM
Performing EM optimization ...
Performing gradient-based optimization:
Iteration 0:   log likelihood = -9668.0859
Iteration 1:   log likelihood = -9668.0859
Computing standard errors ...
Mixed-effects ML regression              Number of obs   =       3,000
Group variable: country                  Number of groups  =        30
                                         Obs per group:
                                         min =         100
                                         avg  =        100.0
                                         max  =         100
                                         Wald chi2(3)     =       401.00
                                         Prob > chi2      =       0.0000

Log likelihood = -9668.0859
```
