

Visualizing Multilevel Models

Andy Grogan-Kaylor

2 Mar 2023 14:38:03

Introduction

An evolving set of notes on visualizing results from multilevel models.

The examples below use the `simulated_multilevel_data.dta` file from *Multilevel Thinking*. Here is a direct link to download the data.

Setup

I am not terrifically fond of Stata's default `s2color` graph scheme. Therefore I make use of the `michigan` graph scheme available at: <https://agrogan1.github.io/Stata/michigan-graph-scheme/>

```
. set scheme michigan
```

Stata's `slcolor` scheme would also be an option as would be Asjad Naqvi's incredible `schemepack`: <https://github.com/asjadnaqvi/stata-schemepack>

Get Data

```
. use "https://github.com/agrogan1/multilevel-thinking/raw/main/simulate-and-analyze-m  
> ultilevel-data/simulated_multilevel_data.dta", clear
```

Scatterplots

```
. twoway scatter outcome warmth  
  
. graph export myscatter.png, width(1500) replace  
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/myscatter.png saved as  
PNG format
```

Simple Linear Fit

```
. twoway lfit outcome warmth  
  
. graph export mylinear.png, width(1500) replace  
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/mylinear.png saved as  
PNG format
```

Linear Fit With Confidence Interval

```
. twoway lfitci outcome warmth  
  
. graph export mylfitci.png, width(1500) replace  
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/mylfitci.png saved as
```

Figure 1: Scatterplot

Figure 2: Linear Fit

PNG format

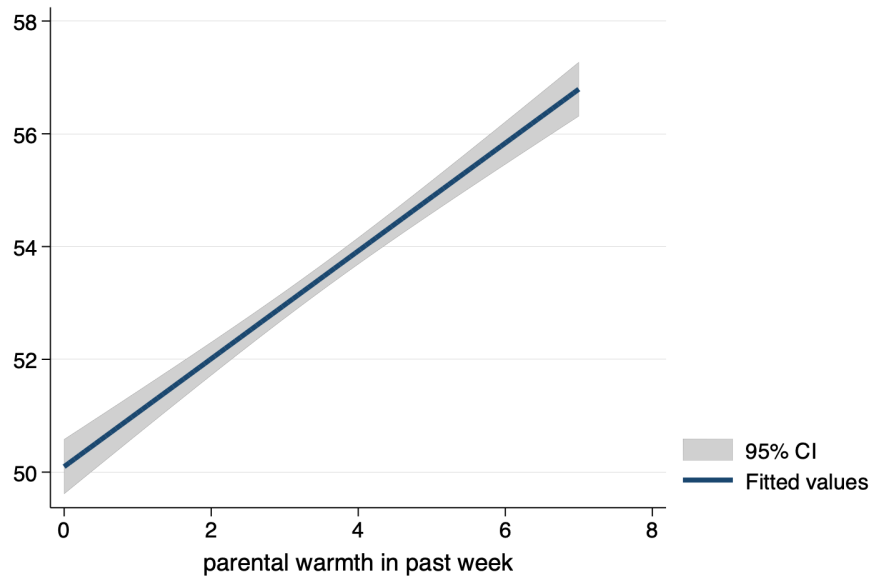

Figure 3: Linear Fit With Confidence Interval

Combine Scatterplot and Linear Fit

```
. twoway (scatter outcome warmth) (lfit outcome warmth)
. graph export myscatterlinear.png, width(1500) replace
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/myscatterlinear.png
  saved as PNG format
```

Spaghetti Plots (spagplot)

```
. spagplot outcome warmth, id(country)
. graph export myspaghetti.png, width(1500) replace
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/myspaghetti.png saved
  as PNG format
```

Small Multiples

I use the `aspect` option to adjust the *aspect ratio* of the graph for better visual presentation. I also use the `mcolor(%30)` option to create some transparency in the dots of the scatterplot, which helps the presentation of these small multiples. The `mcolor(%30)` option could be useful in the other graphs in this tutorial as well.

```
. twoway (scatter outcome warmth, mcolor(%30)) (lfit outcome warmth), by(country) aspe
> ct(1)
. graph export mysmallmultiples.png, width(1500) replace
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/mysmallmultiples.png
  saved as PNG format
```

Multivariate (Predicted) Relationships

A sometimes unacknowledged point is that graphs—unless we take steps to correct this—reflect *unadjusted*, or *bivariate* associations. We may sometimes wish to develop a graphs that reflect the *adjusted* or *predicted* estimates from our models.

In multilevel models, *prediction* is a complex question. The procedures below outline graphs that incorporate predictions using the variables, but do not include predictions that incorporate the random effects. (This will be added!)

Using Predicted Values

Estimate The Model

```
. mixed outcome warmth physical_punishment i.group || country: // estimate MLM
Performing EM optimization:
Performing gradient-based optimization:
Iteration 0:   log likelihood = -9668.0859
Iteration 1:   log likelihood = -9668.0859
Computing standard errors:
Mixed-effects ML regression              Number of obs      =       3,000
Group variable: country                  Number of groups   =        30
Obs per group:                           min =          100
                                           avg  =         100.0
                                           max  =          100
                                           Wald chi2(3)      =       401.00
                                           Prob > chi2       =       0.0000

Log likelihood = -9668.0859
```

	outcome	Coefficient	Std. err.	z	P> z	[95% conf. interval]
	warmth	.961837	.0581809	16.53	0.000	.8478046 1.075869
	physical_punishment	-.8457672	.0798128	-10.60	0.000	-1.002197 -.6893369
	2.group	1.084409	.2200548	4.93	0.000	.6531099 1.515709
	_cons	51.64797	.4645466	111.18	0.000	50.73748 52.55847

Random-effects parameters	Estimate	Std. err.	[95% conf. interval]	
country: Identity				
var(_cons)	3.403	.9717558	1.944438	5.955659
var(Residual)	36.01911	.9346952	34.23295	37.89847

LR test vs. linear model: chibar2(01) = 200.29 Prob >= chibar2 = 0.0000

Generate Predicted Values

```
. predict outcome_hat // predict yhat
(option xb assumed)
```

Graph With twoway Syntax

```
. twoway (scatter outcome_hat warmth) (lfit outcome_hat warmth)

. graph export mypredictedvalues.png, width(1500) replace
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/mypredictedvalues.png
saved as PNG format
```

Figure 7: Predicted Values From predict

Spaghetti Plot With Predicted Values

```
. spagplot outcome_hat warmth, id(country)

. graph export myspaghetti2.png, width(1500) replace
file /Users/agrogan/Desktop/GitHub/multilevel/visualizing-MLM/myspaghetti2.png saved
as PNG format
```

margins and marginsplot

Estimate The Model

```
. mixed outcome warmth physical_punishment i.group || country: // estimate MLM
```

Figure 8: Spaghetti Plot With Predicted Values

Performing EM optimization:

Performing gradient-based optimization:

Iteration 0: log likelihood = -9668.0859

Iteration 1: log likelihood = -9668.0859

Computing standard errors:

Mixed-effects ML regression

Group variable: country

Number of obs = 3,000

Number of groups = 30

Obs per group:

min = 100

avg = 100.0

max = 100

Wald chi2(3) = 401.00

Prob > chi2 = 0.0000

Log likelihood = -9668.0859

outcome	Coefficient	Std. err.	z	P> z	[95% conf. interval]	
warmth	.961837	.0581809	16.53	0.000	.8478046	1.075869
physical_punishment	-.8457672	.0798128	-10.60	0.000	-1.002197	-.6893369
2.group	1.084409	.2200548	4.93	0.000	.6531099	1.515709
_cons	51.64797	.4645466	111.18	0.000	50.73748	52.55847

Random-effects parameters	Estimate	Std. err.	[95% conf. interval]	
country: Identity				
var(_cons)	3.403	.9717558	1.944438	5.955659
var(Residual)	36.01911	.9346952	34.23295	37.89847

LR test vs. linear model: chibar2(01) = 200.29

Prob >= chibar2 = 0.0000

Generate Predicted Values At Specified Values With margins

```
. margins group, at(warmth = (1 2 3 4 5 6 7)) // predictive *margins*
```

Predictive margins

Number of obs = 3,000

Expression: Linear prediction, fixed portion, predict()

```

1._at: warmth = 1
2._at: warmth = 2
3._at: warmth = 3
4._at: warmth = 4
5._at: warmth = 5
6._at: warmth = 6
7._at: warmth = 7

```

		Delta-method		z	P> z	[95% conf. interval]	
		Margin	std. err.
